Subject: RE: Some Arsenic Literature

Thank you Cathy, it was great to see everyone there. As I explained before we and the HAMP team need to educate the public as much as we can. We will be asked so many different questions and we need to be prepared for it. I want to thank everyone working on this project to provide safe drinking water and moving forward despite all the obstacles.

Subject: Some Arsenic Literature

Dear All,

Last night, It was wonderful seeing everyone working so hard towards the common good. Thank you for allowing me to come and learn more about the HAMP.

I had mentioned to Mr. Lomahquahu that I would send some recent literature information. There is one study in particular that has been looking at Native American exposure risks associated with health-related outcomes: The Strong Heart study. Here is a link to their website: <http://strongheart.ouhsc.edu/>. While this large project focuses mostly on cardiovascular diseases, they have sub-projects exploring risks associated with arsenic exposure.

I have also compiled a couple of documents, with some overlapping outcomes, on how arsenic may influence cancers. It is a very complicated issue as there are different forms of arsenic, and the exposure doses are important.

I look forward to the continued development of our partnership. I will keep everyone in the loop as the grant unfolds. As such, I am including the NAU partners in our arsenic project on this e-mail: Karen Jarratt-Snider (Assitant Prof, Applied Indigenous Studies), Jani Ingram (Assoc. Prof, Chemistry), and Joelynn Ashley (Admin. Assoc., Applied Indigenous Studies).

Thanks again in advance for everyone's support,

Catherine R. Propper, Ph.D.
